# I. Experimental Evidence

#### **Case study:** <sup>171</sup>Yb nucleus high spin rotational bands

FIG. 5. Level scheme for  $^{171}$ Yb.

D.E.Archer *et al*, Phys.Rev. C57, 2924 (1998)

# How the bands can be described? $(\Delta E_{\gamma}^{x}, \Delta E_{\gamma}^{y})$ Differential Coincidence MatrixBohr-Mottelson Collective RotorBitmap Distribution

$$E(I) = \frac{\hbar^2}{2\Im}I(I+1), \quad c = \frac{\hbar^2}{2\Im}$$
$$E_{\gamma} = E(I) - E(I-2) = \frac{\hbar^2}{2\Im}(4I-2) = 2c(2I-1)$$
$$\Delta E_{\gamma} = E_{\gamma}(I) - E_{\gamma}(I-2) = 8\frac{\hbar^2}{2\Im} = 8c$$

 $2\mathfrak{I}$ 

New Parametrization (average behavior)  $E_{\gamma} = 2c(2I + k - 1), k \text{ integer}$ 

- 2c Moment of Inertia, Real
- (2I+k-1) Angular Momentum, Integer

#### **Case study:** <sup>171</sup>Yb nucleus high spin rotational bands

# **II. Level Scheme Re-Concept**

### What we got for the average description of <sup>171</sup>Yb bands? k-Generalized Ideal Rotor bands:

For **k=0**, **Bohr-Mottelson Ideal Rotor** bands: described by the 2cl(I+1) rule for even and odd spins

For  $k \neq 0$ , k-Generalized Ideal Rotor bands: have the same  $\mathcal{J}_{eff}^{(2)}$  (same 2c) but are no longer described by the 2cl(I+1) rule.

### **Q**: How to place the k-generalized ideal rotor bands in the level scheme?

A: By adding 2I+1 "stairs" of 2c levels to the k=0 band!

One gets a "parabolic 2D building" on which:

- k=0 bands are vertical paths
- k≠0 bands are tilted paths
- In general, the energy levels can be indexed by three integer numbers, (I,m,n), where:
  - Lis the nuclear spin,
  - <u>m</u> is the position of the "stair" level relative to the spin
  - <u>n the energy of the level, which is a natural number in units of 2c.</u>
- <u>Triple coordinates suggest 3D level scheme</u>!

#### Part I: Level scheme of Generalized Ideal Rotational Bands

**Average Ideal Rotational Description** 

#### **Parametrization:**

 $E\gamma = 2c(2I + k - 1)$ 

2c **Real**, (2I+k-1) **Integer** 

2c, k from least-squares fit

Fig. (Generalized Ideal Rotation Bands)

#### Part II: Level scheme of Real Rotational Bands

<u>Real Bands Rotational Description</u> Decomposition:

$$E\gamma = 2c_{band}(2I + k + k' - 1)$$

$$2c_{band}$$
 Real,  $(2I+k+k'-1)$  Integer

$$2c_{band} = 2c[1+fn/(2I+k+k'-1)]$$

### **III. Insight into High-Spin Physics**

### Elementary Helix Loop with y transition

### $E\gamma = 2c_{band}(2I + k + k' - 1):$

 $\Delta \theta = 0, 2\pi$  Elementary Helix Loop Rotation *due to 2I Macroscopic Collective Motion* 

- γ-decay paths: along vertical diameter
- $\Delta \theta \neq 0$  Band's Apparent Rotation on the Helix *due to k+k' Microscopic S.P. Motion*
- $\gamma$ -decay paths:  $\Delta \theta < 0$  clockwise precession
- $\gamma$ -decay paths:  $\Delta \theta > 0$  counterclockwise precession

**Phase angle of levels on helicoid:**  $\theta(I, m) = \sum_{I,m} (I + \frac{m}{I}) \pi$ 

**Phase shift between two consecutive band levels:**  $\Delta \theta(I) = \theta(I) - \theta(I-2) - 2\pi$ 

Fig. ( $\Delta \theta$  apparent band rotation on the helicoid)

### **Double Helix Level Scheme Summary** *I Repeatability II Double Helix III Double Helix Level Scheme*

### Double Helix Level Scheme Insight: Investment in Nuclear Structure Building

- Double Helix is the geometrical place of the discrete set of spin states available for the rotational motion of the nucleus, which defines a Semiclassical Meta-Trajectory
- On average, one can assume that Nuclear Matter itself follows the Semiclassical Meta-Trajectory on Double Helix, with the actual levels selected by the rotational bands' paths
- Semi-classically, through Repeatability Nuclear Matter's Double Helix Motion <u>can be seen as a Vortex Motion</u>
- This can indicate vorticity in the liquid drop and relax the irrotational flow hypothesis on Bohr-Mottelson model
